Hi all. I'd like to put analyzing the new flow on the to-do list, if possible. If we can get decent videos of the new flow we could talk about it during Monday's call and come out with a statement on the increase in the flow rate (if detectable given our large uncertainty) during this operation. The flow that we're seeing today is especially easy to analyze because, being vertical, we don't see separation of the oil and gas so there isn't the intermittency that we see from the horizontal riser tube. This case is similar to the kink leaks that I think everyone found easier to analyze.

Best,

Steve Wereley, Professor of Mechanical Engineering  
Birck Nanotechnology Center, Room 2019, 1205 West State Street

Hello everyone

I just had a telephone inquiry from the Wall Street Journal

Question: "... looking at the pictures, the spill rate seems to be much higher. Do you have a new estimate?"

My answer: " The FRTG is working on it, and we will have a conference call on Monday. It would be prudent to wait till after that."

Regards

Ömer
